This Presentation Paper is brought to you for free and open access by the Division of Emergency Medicine/Emergency Care Research Section at Digital Commons@Becker. It has been accepted for inclusion in Conference Abstracts and Posters by an authorized administrator of Digital Commons@Becker. For more information, please contact vanam@wustl.edu.
CHARACTERIZATION OF SHORT QTC INTERVAL IN EMERGENCY DEPARTMENT PATIENTS

Peta-Gay Nolan  MD
Stacey House MD, PhD
S. Eliza Halcomb MD
Washington University in St. Louis School of Medicine
Contributors to Short QTc Interval

- **Congenital**
  - Short QTc Syndrome, <300ms
  - Channelopathy with gain of function genetic mutations

- **Prescriptions**
  - Thiazides
  - Lithium
  - Digoxin

- **Lab abnormalities**
  - Hypercalcaemia
  - Hypokalemia
Complications of Short QTc Interval

- Early repolarization
- Atrial fibrillation
- Atrial flutter
- Ventricular fibrillation
- Sudden death
- Inducible ventricular fibrillation
Treatment of Short QTc Syndrome

- Implantable cardioverter/defibrillator
- Hydroquinidine (prolongs QT)
Objective

The study objective was to characterize the ED population with Short QTc Interval.

- Electrolyte abnormalities
- Temperature
- Chief complaints
- Presenting symptoms
- Medications
Method

- Retrospective review of all ED patients who received an EKG from December 1, 2008 to November 30, 2009

- Inclusion Criteria
  - QTC ≤ 390 ms

- Exclusion Criteria
  - Bradycardia (HR < 60 bpm)
  - Tachycardia (HR >100 bpm)
  - QRS >120 ms
  - Non-sinus rhythm
  - Left without being seen
Patient Enrollment

27,119 Patients

26,579 pts (98%) QTc > 390 ms

540 pts (2%) QTc ≤ 390 ms

265 pts (49%) Excluded

275 pts (51%) Eligible

211 pts (77%) QTc 380-390 ms

48 pts (17%) QTc 370-379 ms

16 pts (6%) QTc ≤ 369 ms

% of all pts 0.8% 0.2% 0.1%

Excluded Patients
Bradycardia 184 pts
Tachycardia 28 pts
Non-sinus rhythm 62 pts
Paced rhythm 24 pts
QRS > 120 ms 8 pts
LWBS or AMA 13 pts
Results

- These pts were 40±19 years old
- Male - 73%, 95%CI 68-78%.
Comorbidities

- Hypertension (Htn)
- Diabetes (DM)
- Congestive Heart Failure (CHF)
- Coronary Artery Disease/Myocardial Infarction (CAD/MI)
- Pacemaker/AICD
- Arrhythmia
- Psychiatric Disorders
- Drug Abuse
- HIV
Results

- 15% (95%CI 10-20%) had abnormal serum potassium.
- 13% (95%CI 9-18%) had abnormal serum calcium.
- 2% (95%CI 0.5-3.9%) were hyperthermic.
Results

- Only 3% (95%CI 1-5%) were on home medications which shortened QTc interval including <1% on Digoxin, the most commonly described cause of medication-induced short QTc.
- 67% (95%CI 62-73%) were discharged from the ED.
- There were no significant differences among the different length QTc groups with regards to comorbidities, symptoms, electrolyte abnormalities, QTc shortening medications, or disposition.
Discussion

- Shortened QTc interval occurs in 2% of ED patients
- <0.1% have QTc<369 ms
- Very small portion with short QTc interval also have hypercalcaemia, hyperthermia, and/or Digoxin therapy.
- As the majority of these patients are discharged to home, further studies are needed to determine the rates of cardiac events in patients with shortened QTc interval.
