BACKGROUND

• Previous research suggests that panic and anxiety disorders and substance use disorders co-occur
• The relationship between panic disorder and cannabis use, abuse and dependence is not well characterized in adolescents and young adults
OBJECTIVE

• To examine the relationships between cannabis use, abuse and dependence and panic symptoms/attacks/disorder in adolescents and young adults
METHODS: Subjects

Twins as Parents (TAP) study (2000-present)

• Fathers
  – 910 twin fathers sampled from the Vietnam Era Twin Registry with at least 1 child 12-28 yrs old in 2000
  – Twin pairs either concordant or discordant for psychoactive substance use disorders (primarily MJ A/D). Controls were unaffected twin pairs
  – 725 (80%) responded to diagnostic telephone interview

• Mothers
  – 601 eligible biological and/or rearing mothers with consent from twin
  – 428 (71%) responded to diagnostic telephone interview

• Offspring
  – 986 eligible offspring with consent from father and/or mother
  – 832 (84%) responded to diagnostic telephone interview
METHODS: Assessment

Offspring report:

- Lifetime DSM-IV cannabis use, abuse and dependence

- Lifetime DSM-IV:
  - Panic Disorder
    - Panic Attack
    - Panic Symptoms
MEASURES:

• Symptoms of a Panic Attack
  • Developed abruptly and peaked w/in 10 min:
    1) Heart palpitations
    2) Sweating
    3) Trembling/shaking
    4) Shortness of breath
    5) Choking feeling
    6) Chest Pain
    7) Nausea/abdominal pain
    8) Dizzy/lightheaded
    9) Derealization/depersonalization
   10) Fear of losing control
   11) Fear of dying
   12) Paresthesias
   13) Chills/hot flushes
MEASURES: DSM-IV Panic Attack and Panic Disorder

• Full DSM-IV criteria for panic attack (PA)
  – *Discrete period of intense fear or discomfort, in which 4 or more symptoms developed abruptly and reached a peak within 10 minutes*

• Full DSM-IV criteria for panic disorder (PD)
  – *Recurrent unexpected panic attacks, at least one attack followed by one month of: either persistent concern, worry, change in behavior*
MEASURES: Cannabis Use

• Among all respondents:
  – Ever used
  – Regular use ($\geq 6$ times in life)
  – Current use (past 12 months)
  – DSM-IV cannabis abuse/dependence

• Among users only:
  – Regular use ($\geq 6$ times in life)
  – Current use (past 12 months)
  – DSM-IV cannabis abuse/dependence
  – Lifetime quantity
METHODS: Data Analysis

• Measures of Association:
  – Chi-square
  – Odds Ratio (OR)
## RESULTS

CONCLUSIONS

• Panic symptoms, attack and disorder are associated with cannabis use but not regular use, current use or abuse/dependence among cannabis users

• Further research is needed to:
  – Adjust for the paternal drug use history (environment and genetics), age and gender
  – Derive multivariate models to determine which other psychiatric and substance use disorders contribute to the panic/cannabis use relationship
  – Examine temporal relationship between panic and cannabis use
