S5 Fig. Experimental dose response matrices.

Experimentally measured drug-drug dose response matrices, ordered by total activity. The effects range from potentiation-like synergies (e.g., Sulfx+Trimp), through non-interacting pairs (e.g., Nfurz+Trimp), to antagonisms (e.g., Ampcl+Sulfx). There were also inactive single agents such as Dfrox and Tcarb for which interactions could not be accurately determined. Synergy scores were calculated and compared to the simulated dose-response matrices.
