Supplemental Figure 3. (related to Figure 9). Representative electron micrographs from an untreated, WT mouse. Lens epithelium at low magnification for (A, B) 196-day-old mouse lens, as well as for higher magnification (C, D). The cell-cell contacts appear to be normal and did not display any gaps at low or high magnification. Representative electron micrographs of lens fiber cells (E, F) for a 196-day-old mouse lens. Fiber cell packing has canonical hexagonal packing. Scale bars, 2 µm, white (A, B, E, F); Scale bars, 0.5 µm, white.
