In the last Lecture I divided the History of Medicine, as far as it is connected with my Branch into seven Parts, or Ages. I said the first extended from the Beginning of the Art till the time that Philosophy was conjoined with experience & Observation by Hippocrates, about four hundred years before Christ; the second from the Establishment of Dogmatism by Hippocrates to the rise of the Empyric sect which was commonly imputed to Serapion about the time of the Reign of Ptolemy Philadelphus; the third from the last to the rise of the Methodists which is a Branch of Dogmatism imputed to Rhemison in the time of Augustus Caesar; the fourth commencing at this Period continued till the Dogmatism of Hippocrates was restored by Galen in the Reign of the Emperor Marcus Aurelius about the middle of the second Century. I said that the fifth Age was a very long one continuing till the time

2^d Time of Paracelsus in the Beginning of the 16th Century 1st. - Sera was soon after strongly mark'd by the Beginnings of Reformation of Religion by Luther; the sixth beginning from this Period continued to the Discovery of the Circulation by Harvey & was generally received over Europe about the Middle of the last Century. The seventh & last from the Discovery of the Circulation to the present time.

To return to the first of these Sera's we may suppose first of all that a natural Physic prevail'd which could not go any longer till it came to be join'd with the refined Arts or natural Philosophy. Accordingly the natural Physic of the Greeks was obscured by the more refined of Egypt, & that of Rome by that of Greece.

On this Plan we shall consider our Art as it appear'd first in Egypt; we have several but imperfect accts of the state of Physic in that Place. We are told they had Books upon several Sciences & Arts, & particularly that of Medicine, ascribed to Hermes Trismegistus, & committed to the care of the Priests. This Precaution might

prevent the Mischief arising from rash En-3-
terprisers in Medicine but would equally pre-
vent the Progress of the Art, & indeed it was
the common fault of the Egyptian Policy to
fix Science too early. Another Regulation
we find among them of confining the Practice
of single men to particular parts of the Body
in the cure of Diseases, we therefore ^{cannot} in this
Respect admire the Egyptian Policy, but as
I said our accounts are too imperfect to jus-
tify us in concluding strongly against them.
We have scarcely any Acc^t of the Natural Phy-
sic of the Greeks it being all involved in Fan-
ble. But it is most probable that it came to
them from the Egyptians by the hands of the
Phœnician Merchants. Superstition is quite
natural to man, hence some have taken hold
of that handle to lead & govern them, & ^{not} the
love of Health & fear of Death is the chief
foundation in Nature of Superstition, it gave
a most proper handle to Priests to engage in
Physic; & indeed not only then, but in all Ages
they have, less or more, inroached on the Pro-
vince of the Physician. Asclepiades was both a

As an Egyptian & Grecian Deity; it was in his
Temple that Remedies were committed to the
Priests by Dreams; it is a curious inquiry
how soon these Priests became practical Phy-
sicians, or these last became a Profession of men
separate from Priests of Esculapius, the pre-
cise time however we cannot exactly ascertain
& we can only suppose that this separation of
the Profession would ~~only~~ take place by de-
grees, & some time tho' not long, before Hippo-
crates tho' the Priests of Esculapius employed charms
yet as those would not be sufficient, we may
suppose they studied the nature of Diseases
& Remedies the better to support their Trade -
Their Observations would be recorded in the
Temples, hence a register of experienced Remedies.
Thus these Temples were so many schools of
Medicine, & perhaps the only schools where it
was to be acquired. The most celebrated Temples
were those of Rodas, Cos & Rhodus &c in this
shape then either natural or superstitious
Medicine continued till the time of Hippocra-
tes. During this whole Period it depended all -

together on experience, & little Reason was
employed, for men uncultivated by Philosophy
never ~~deliberate~~ ^{deliberate} supposition being on the
result of more enlightened Ages - we have no
Materials to lead us to the Methods of their
Practice - it is only the Writings of Physicians
wh. we can judge; but there are none in this
Period. Therefore when we give our judgement
on this particular, as we come to treat of the
second Age, that judgement may be supposed to
affect this matter, equally with regard to the first.
Hippocrates was supposed to have died the year before
Alexander the great was born, 200 years before the
Building of Rome, 500 years before Christ & 900 after
Philosophy was introduced into Greece. As there was
much system at this time it could not have been
formed all at once by Hippocrates, & therefore as
it must have been the work of time we must
look both for gradual advances of it. Men
Naturally enquire after causes but we can not
say to what length they proceed in this case
by the Assistance of rude Nature. In this
Enquiry we must confine our selves to Greece -
Thales, 600 Years before Christ formed the -

6 school, & not long after Pythagoras founded his school. We know they applied diligently to natural Philosophy & Medicine, particularly Pythagoras. Alcmaeon is said to have been the first Anatomist & another was even famous for Practising Medicine.

Before Hippocrates tho' they attempted Anatomy yet Dissection had not yet touched the human Body & at this Period, in my Opinion, the Use of Philosophy in Physic was very inconsiderable.

Lec: 3^d. Nov^r. 11th.

Methodics, while they endeavoured to limit Dogmatism did not exclude Empiricism. In Egypt we find it tho' obscurely — after that introduced among the Greeks not in its own proper form but as an Eschaplarian Superstition. Tho' in the Management of Dreams & Thrust-braff showed itself, yet there was an aim at Experiment, Diseases being studied, to support the Trade, & particularly Prognostics. Hippocrates was bred in one of these Temples in which the School existed studied Natural Philosophy, separated this Branch, & began the second Period of our History.

The whole of that Philosophy was not the Invention of Hippocrates, it having been introduced to Greece

by Thales & Pythagoras 200 years before. Very early the Philosophers of Greece considered Diseases & made more or less of their Philosophy. Alcmaeon of the Pythagoric Sect first Dissected, & Empedocles from the same was eminent for Practising. Heraclitus we find commonly dividing the Physicians, & a formal Opposition between Empedocles and the Physicians had not yet shided Philosophy when Hippocrates appeared. It was about the supposed time of Hipp. that it was introduced into the Schools of Greece.

Account is inconsistent with every other account that we have, do we find in the Writings & History of Hippocrates himself, but he is not mentioned by contemporary Historians & the only account by an obscure writer Soranus who lived 400 years after Hipp. And I can not help suspecting the Prejudices of Galen many more than the Testimonies of Suidas many of Hippocrates' writings spurious. If we admit only for genuine the writings that consist only of facts they represent him as a Dogmatist, if we take in more of his writings we find to all intents & Purposes we represent Hipp;

8 as almost a Duty, & the Age in wth he lived
as the most wise, but the Age in which he lived
was the most frivolous. We believe he lived
rather more early than is commonly supposed
& in Thessaly & other Provinces remote from
Athens, hence so much the more admired, &
his Character, introduced by Disciples, magnified
I believe them to have been as wise as his Age
would admit of but his Age very imperfect. If
we take all of his writings we shall find them
inconsistent & absurd, if we take a Part we
shall find good prognostics, little Practice &
little System; the first & third Books of the
Epidemics are pure & of some use, the others
are of very doubtful Elevation: the Whole of the
Aphorisms, usefull but difficulted in this Age to
support their Character. The Nature, course
& Effect of Diseases differ considerably from
those of Hipp. & therefore no Reasoning ought
to be used to bring them up to the Diseases of
that Clime & Country; In the other Works
ascribed to him you will seldom find order,
method or Connection. Erasistratus & Hierophilus
differed from, & detracted from him. & hence to see

derapion, declaimed so freely against him &
that his Name would have been annihilated
had it not been for Galen. It appears
that the Family of Hipp. continued. Alcmaeon
as we see in his son-in-law Phraeo. Next
Rethagoras the last of the Asclepiads of any
great name but tho the Foundations of Dog-
matism was so weak that it was impossible
to build upon them, yet Facts were better col-
lected than by mere Empiricism & hence
Anatomy was cultivated by Hierophilus &
Erasistratus. The Particulars of either of their
Anatomy or Practice do not belong to this
Place but they were both Men of Genius &
not cautious & diffident of Dogmatizing &
were for conforming their System to the Orga-
nie neglecting the Fluids. Erasistratus
was timid in the use of strong Remedies -
Hierophilus used a great many, this gave
chief occasion to the rise of the Empyric
sect. — Lect. 15th Nov. 12th
The second part of our History gives the Age

10 of Philosophy & Taste; the Industry & good
sense of Herophilus & Erasistratus promised
to put medicine upon a tolerable Foundation.
This was the Age of Ptolemy Philadelphos,
all were Dogmatists at this time; nor the
Empyric sect arose they formed a distinct
sect; they were so from perceiving the Fala-
cy of Theory & therefore recommended ex-
periment. It is imputed to Philinus of Cos, a
Disciple of Herophilus & Scapion the Alexan-
drian, which was the True Author is uncertain
but I suspect each of them had a share in the
Innovation & engaged in it from different Mo-
tives Philinus might be determined to favour
Empyricism but as he was a Disciple of Hero-
philus he could not be so determined an Enemy
to Dissection as the Empyrics were. The Egyptians
and Jews people who embarked in as much contempt
as executioners, the Operator was obliged to fly
from a shower of Stones thrown at him by the
Audience, & such was their Aversion at Touching
Dead Bodies that perhaps only an Opinion of very
superior Skill could in any Degree reconcile them

to it, hence Dissection would be more popular
to set up in Opposition to Anatomy at Alexan-
dria, these two gentlemen could not all at once
find out all the specious arguments that could
be employed against the Dogmatists; their data
were reduced into three Parts and consisted of
observation, History & Analogy. They proposed
that a Collection of Observations should be made
& their History made up of that, & if both then
failed that they might have recourse to Analogy
or a Transitus ad Simile. I shall not touch
the Arguments on both sides as they are to be
treated of very fully hereafter. The Empyrics
subsisted till Galen, but they never made great
Impression in checking the Dogmatists. We hear
of no new, or efficacious Remedies & which was
still more to be expected we hear nothing of ^{their} his-
tory which would have been generally known if they
had done any theory in that way, I think it wrong
to account for, such a neglect as that of Empyri-
cism is always a cover for Dullness & ignorance
& to prosecute a plan like this in a useful way it
requires great subtility & refinement; & if any man

12 set seriously about it he would not appreciate with
such a set as Conspirators, & rather assume the more
specious name of Dogmatist.

I have more to say on the third Part than that
Dogmatism still persisted the divided into little
Sects, under the Names of their different Leaders,
as Hippocratic, Praxagoric &c. & all agreed in the
general Plan of Dogmatism. I shall now pass over
to the Romans & show how it first appeared among
them. Evident alie (Virg. Aeneid. l. 6) plainly
show the Romans disclaimed all pretensions to
Arts, w^{ch} they probably were without for 600 years,
& late about the 600 year of Rome gives you an
Invitation on the Production of a fractured Bone
which would not have been the case if there had been
any shadow of Science in the Country. The Cou-
lapien Physic came to Rome first, w^{ch} as it was
rather under the form of superstition than Science
was suppressed by Argaeathus a Greek surgeon
he was cruel in his practice & brought a Decemviral
Disrepute which afterwards recovered ground with the
Arts & Sciences Introduction & cultivation of the
Grecian Arts & Sciences under the more gentle form
of the Erasistratean Medicine. Aesculapius came

to Rome among many other Greeks to make his 13
fortune & from being Historian in which he
was abundantly successful turned Physician.
He seems to ^{have} been imbued with the Doctrines of
Erasistratus he turned a Dogmatist on the Phy-
losophical System of Epicurus, then in Vogue
& illustrated by Lucretius. He formed new Theory
& Practice suited to the Manners & Taste of the
Romans, he gave wine to the sick & what is
more luxurious still, jelly water. He professed
to cure gicunde, Aule & cito. — With elegant Man-
ners, succulent Delicacies, agreeable practice & some
Boasting, how could he miss to be famous; accord-
ingly he was blest by all the Ladies in Rome to
have raised one from the Dead. He supposed the se-
veral Passages or pores as he called them, of the Hu-
man Body, of various shapes & sizes & Molecular
Passing through them exactly adapted to their
Capacity, & he adapted these Pores & Passages to his
Medicines & Practice. Since Thomson took the hint
& to abbreviate the Work both of Theory & Practice
thought it enough to suppose that all Disease ex-
isted either in a contraction or Enlargement of
these Passages, or in a Mixture of Both, that is,
